

The Project – New Mini Showroom

The Brief

Having worked with this client on previous projects we were invited to tender for the Fibre and Copper Network Infrastructure incorporating AV, Wi-Fi, CCTV, Data, and Door Access Controls in the Clients New Mini Showroom, which incorporated Sales, Servicing, Workshops and MOT Areas. Additionally, there had to be links to the Clients main dealership building 200metres away in both fibre, copper and multicores.

The Proposal

We worked closely with the client's architects and main contractors from the initial drawing stage to ensure a network infrastructure throughout the building that would service the required installation, offering flexibility and growth when and where required.

The Technology

Knowing the Client well we were aware of the end use requirements, offering a robust and stable platform, so opted for OM4 Multimode Fibre and Nexans Cat 6 Lanmark copper cable with Keystone Modules offering a 25 warranty.

The Installation

Working with the main contractor to ensure the containment met with the Clients requirements and complied with the latest BICSI regulations.

The Challenges

Given the corporate installation of MINI dealerships with every wall floor and ceiling being painted Black we had to ensure the finished surfaces were not marked. Modules and Faceplates had to be colour coded to match the décor throughout the build.

The Follow Up

Upon completion, full Test Results and Marked up drawings of cable runs and outlets were produced and provided to the client.
